

FactoryLogix MES Business Value Reports

Non-Qualified Operator Action Prevention

This report shows the number of instances where FactoryLogix has proactively prevented operators from carrying out actions they are not qualified for. Ensures that training and certification requirements are enforced by the system to prevent issues related to competency and compliance.

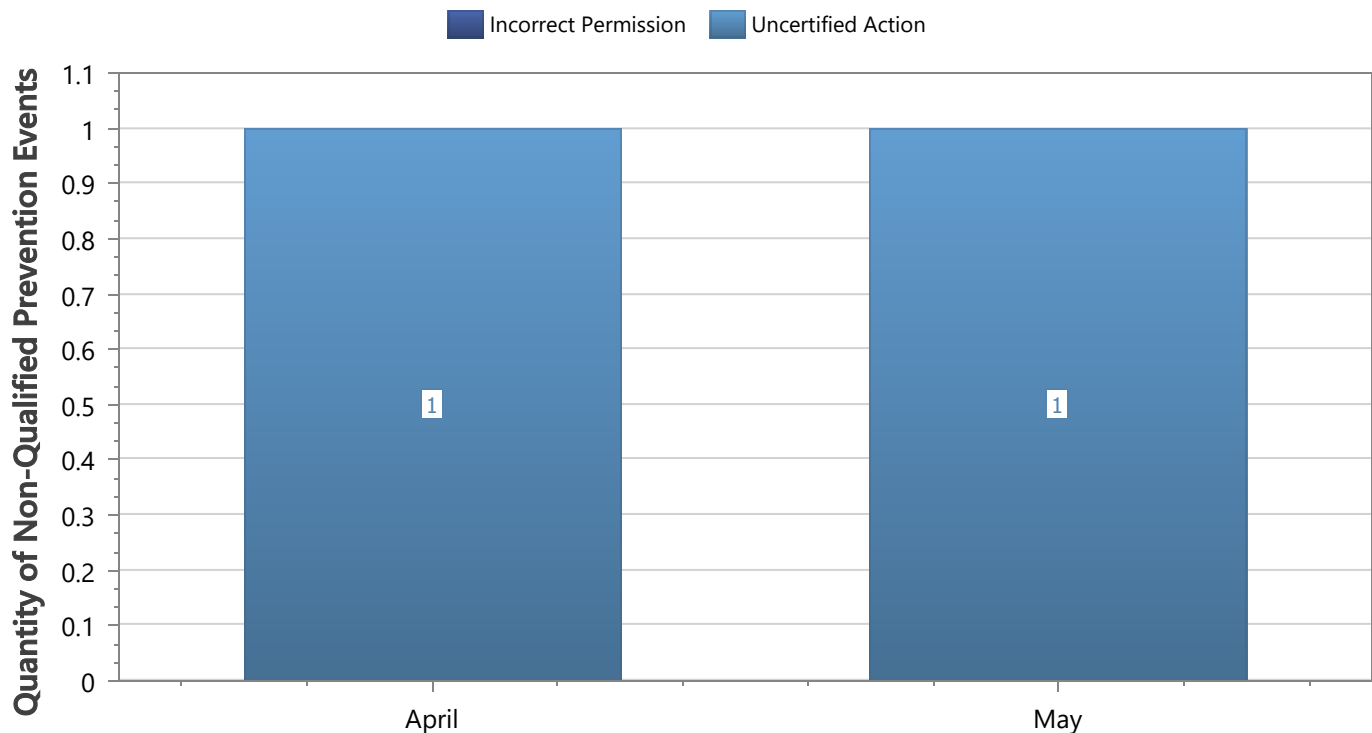

Individual operator validations are performed when operators try to access operations and carry out actions they are not qualified to carry out or have been denied permission for:

Incorrect Permission Prevention - System prevented an operator from carrying out actions that have been restricted to roles they have not been granted.

Uncertified Action Prevention - System prevented an operator carrying out an action they are not qualified to perform.

The chart below shows a summary of all non-qualified operator action prevention events grouped by calendar month and organised by validation category:

Non-Qualified Operator Action Prevention by Month

The chart below shows a summary of all non-qualified operator action prevention events grouped by operation and organised by validation category:
