

FactoryLogix MES Business Value Reports

Serial Number Error Prevention

This report shows the number of instances where FactoryLogix has proactively prevented the creation, or use, of product and material serial numbers when they do not conform to the required templates, or are not unique. This prevents incorrect and unknown serial numbers being used, which could result in compliance and quality issues.

Individual serial number validation events are performed when registering or trying to use serial numbers preventing issues being created and reaching end customers:

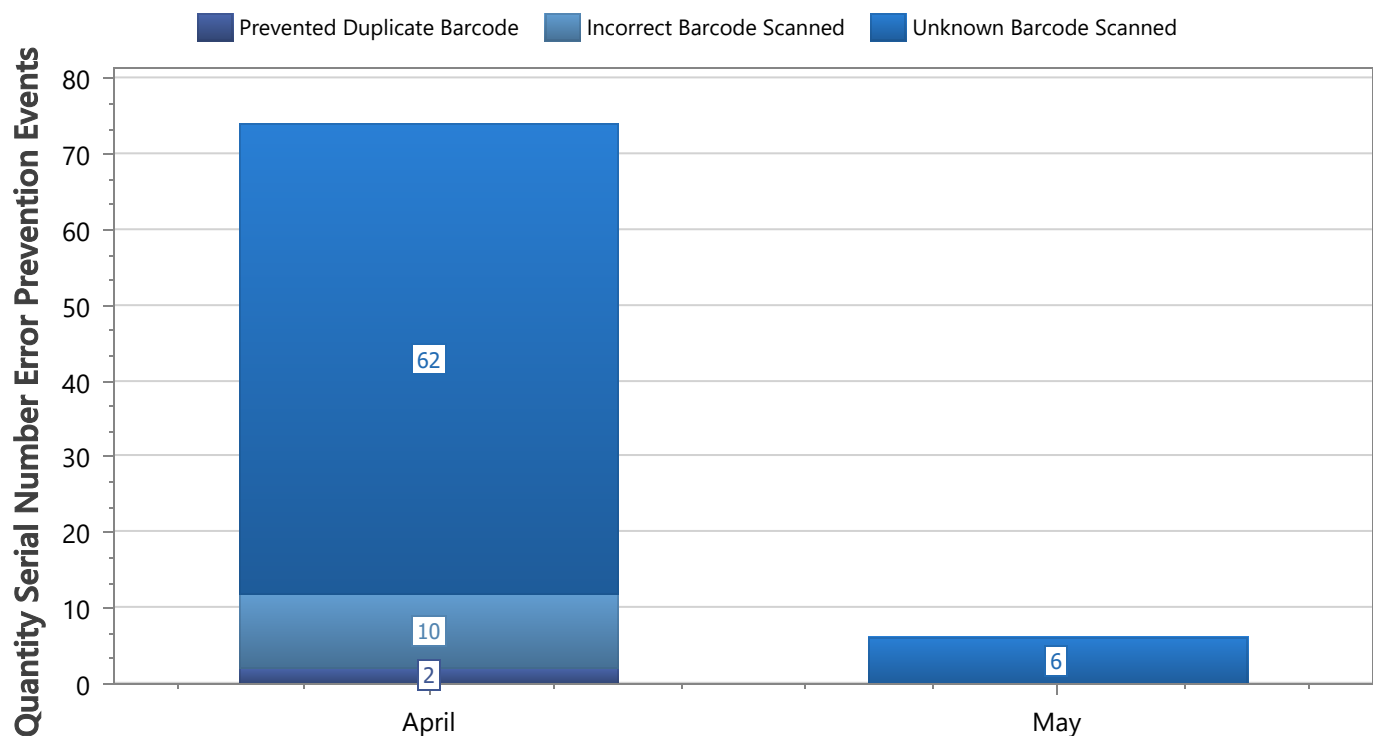

Prevented Duplicate barcode: system prevented a duplicate serial number from being created.

Incorrect barcode scanned: system prevented an incorrectly formatted serial number from being created or used.

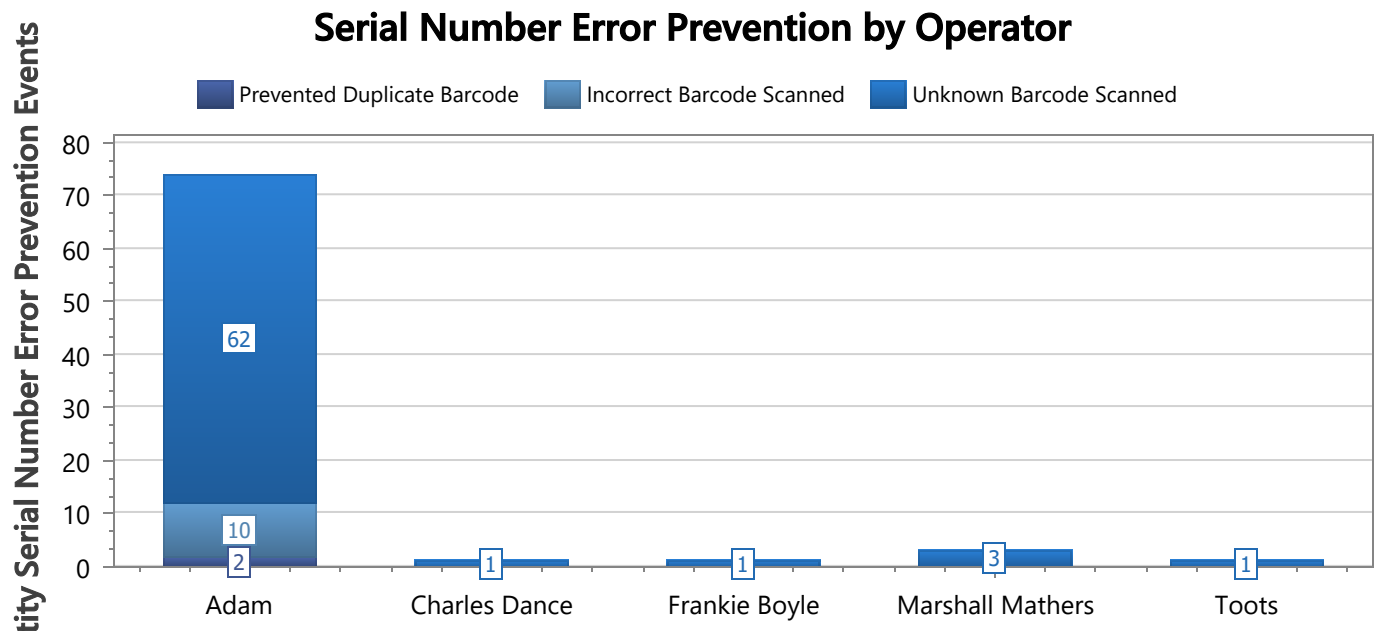

Unknown barcode scanned: system prevented work being carried out on a serial number that is not known to the system.

The chart below shows a summary of all serial number error prevention events grouped by calendar month and organised by validation category:

Serial Number Error Prevention by Month
